

Challenge: Automating Influencer Collaborations at Scale

Presented by Prenew

What is Prenew:

Prenew is a Finnish startup building Europe's most trusted marketplace for refurbished gaming PCs. Founded in 2024 now +€3M raised in the past year and now operation across Europe with operations in Espoo and Berlin

The Problem

Influencer marketing works, but finding the right influencers doesn't scale. At Prenew, we rely on partnerships with creators to reach new customers across dozens of markets. The bottleneck isn't strategy or budget, it's discovery.

Today, finding good influencer partners — especially smaller, niche creators with genuinely engaged audiences — is still largely manual work: scrolling through Instagram, TikTok, and YouTube, checking follower counts, eyeballing engagement, and guessing at audience fit. This process is slow, hard to repeat across markets and languages, and it tends to overlook exactly the creators who are often the best value: micro- and mid-tier influencers who are too small to show up on typical influencer platforms, but whose audiences are highly relevant.

The Challenge

Build a tool or workflow that automates the discovery of relevant influencers with a particular focus on smaller creators who are hard to find through existing tools.

Your solution might tackle discovery from any angle, such as:

- **Automated sourcing:** surfacing candidate creators from social platforms based on niche, content style, audience, or keywords, instead of manual searching
- **Relevance and fit scoring:** going beyond follower count to estimate audience match, engagement quality, and brand fit
- **Multi-market, multi-language support:** since brands like Prenew operate across many countries and languages, solutions that generalize across markets are especially valuable
- **Outreach-readiness:** helping turn a shortlist of candidates into something a marketing team can immediately act on (contact info, suggested pitch, etc.)

We're open to different approaches: scraping and enrichment pipelines, LLM-based agents that reason over social content, recommendation systems, browser extensions — whatever gets to a genuinely useful discovery workflow.

What a Great Solution Looks Like

- Meaningfully reduces the manual effort of finding relevant creators
- Works well for smaller/niche influencers, not just accounts with huge followings that are already easy to find
- Works well in big and small market alike

- Is realistic to plug into an actual marketing workflow
- Ideally demonstrates results on a real example (a niche, a market, a brand vertical)

Why This Matters

Influencer collaborations are one of the highest-potential, least-scaled channels in marketing today. A team that cracks influencer discovery unlocks a channel that most companies currently can't run at the scale it deserves.
